

Every container, accounted for.

A web application that follows radioactive waste containers from truck arrival to final storage: one record, one responsible person and one clear status at every step.

Working prototype · 2026

THE PROBLEM

The trail breaks at every handover

Shipment, container and storage data are spread across paper forms, spreadsheets and separate systems. When containers move between halls and rooms, it is hard to prove who received them and when, and missing or out-of-range measurements are noticed late.

HOW IT WORKS

The container journey

Three work areas cover the journey (Shipments, Pre-storage and Final storage), and each employee can be assigned to one of them.

OVERSIGHT

Conditions and stock, under watch

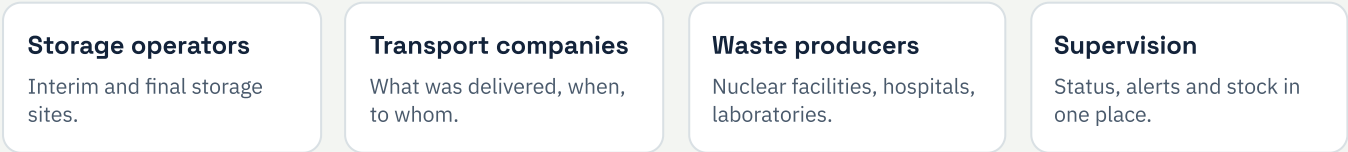

- **Condition alerts** for temperature, radiation, humidity and pressure in every hall and room.
- **Escalation** to Supervision when an alert is not handled; it closes only after a control measurement.
- **Stock reconciliation** sets calculated stock beside physical counts; corrections need an administrator.
- **Traceable history** of deletions, alert handling and stock checks.

ACCESS LEVELS

Three levels, clear boundaries

What a person can do	Employee	Supervision	Admin
See overview and statistics	Yes	Yes	Yes
Record incoming shipments	Yes	Yes	Yes
Change a departed shipment	No	No	Yes
Create user accounts	No	Employees	All
Define waste and container types	No	No	Yes

WHO IT IS FOR

Today

A working web application covering the full journey, with access levels, condition alerts and stock reconciliation. Each company's data is kept separate. Demo runs on synthetic data; NWTS is not certified for regulated operation.

Next

A pilot with one storage site, alignment with reporting requirements and sensor integration.
